CubeSats for the monitoring of space debris		

1 Project scope statement

1.1 Product Scope Description

1.1.1 Introduction

Debris in space needs to be tracked in order to prevent its collision with either currently operational space vehicles and satellites or those of future missions. The collection of such information would lead to obvious benefits in mission safety, systems reliability and maintenance cost. Also, it would increase the lifetime of EU and allies' spacecrafts who chose to use this service by making them possible to make the necessary corrections to evade fatal collisions. Furthermore, it would provide, without any setback, all the services that satellites perform – such as internet, television and communication among others.

The purpose of the DebrEyes proposal is to develop the first phase of this project, which consists on three main points:

1. Design of a **CubeSat** for space debris detection and development of one CubeSat prototype for ground validation.
2. In addition to that, a **constellation of CubeSats**, is also studied in this first phase to have as much tracked debris as possible in a regularly updated map.
3. The **image analysing software** for the post-processing of the data will be developed.

1.1.2 Design of the CubeSat

The description of the design of a CubeSat and posterior assembly of an operative CubeSat prototype is developed in this section.

At this point, the following systems will be considered:

- Attitude Control
- Telecommunications
- Sensing
- Energy
- Thermal Control

These are the state of the art subsystems for a satellite (1) to work properly, with the exception of the sensing subsystem which makes our CubeSat revolutionary due to its compact on-board IR camera that will be used in a new way for *detecting* instead of *observing*. This means that the use of IR cameras will be to detect positions and movements when its typical application is just temperature observation. This camera will be more compact than the others available in the market (2) and it will be developed to fulfil high level characteristics of debris detection and vision angle.

CubeSats for the monitoring of space debris

The different subsystems are aimed to be placed inside the CubeSat separately, which means that each subsystem will have its own space. This type of modular distributions allow the obtaining of a light, robust and compact CubeSat (3). Furthermore, thanks to this independence, each subsystem can be developed in parallel (Figure 1).

Figure 1: Example of a modular CubeSat (4)

Another feature that must be taken into consideration at the designing of the CubeSat is the on-board software in charge of the control of all the subsystems of the device.

A prototype of CubeSat will be produced and, when it is finished, a ground test will be developed in order to ensure that all the systems work properly and a validation will be carried out. It is worth noticing that two CubeSats are needed to identify the position and trajectory of the debris, though. In fact, space systems usually have redundant components both for being able to operate in case of failure and for improving the accuracy of the system, which means that a network of three CubeSats working together as a unit is needed to achieve this goal. Thus, the testing of the whole network of three CubeSats is out of the scope of this project.

1.1.3 Description of the CubeSat constellation

A CubeSat constellation is a network of different CubeSats which cover all the globe and work together. An example can be seen in Figure 2, which shows the European constellation of the Iridium satellites.

In this project, each member of the constellation will consist of three CubeSats – from now on called **tracking unit** – in order to obtain the necessary information of the debris – position, velocity – by triangulation, so that the system is able to provide a regularly updated map. The study of this future constellation includes, considering CubeSats and tracking units:

- Study of potential orbits and maneuvers
- Study of the relative orbits in a tracking unit
- Computation of the necessary number of tracking units
- Design of the orbits and maneuvers

This study is crucial for the project as it is the final step in order to have the maximum number of debris detected and predicted so that spacecrafts can perform consequently.

Figure 2: Example of a satellite constellation (5)

1.1.4 Description of the image analysing software

The development of the image analysing software for positioning the debris and predicting their immediate trajectory is vital if the purpose is to avoid them. Once the position, direction and velocity of the detected debris

5. Iridium. Global TT. Coverage Iridium. [Online] Global TT Satellite Provider, 05 03 2013. [Cited: 12 10 2015.] http://www.globaltt.com/en/coverage_iridium.html.

CubeSats for the monitoring of space debris

have been determined, the generation of a map will allow the future users to obtain all the necessary information – such as their size and current orbit – in an intuitive way. An example of a software for debris detection is shown in the Figure 3, in this case the debris are tracked from the Earth through the use of a radar, hence the size of the debris is much bigger than that of the ones that the DebrEyes project aims to detect (6).

Figure 3: Example of a debris detection software (6)

1.2 Project Deliverables

The deliverables that will be submitted to the European Commission during the development of this proposed project are specified in Table 1.

Table 1. List of Deliverables

Deliverable Name	Description
<i>Project Management Plan</i>	Document indicating detailed planning of the project including a project charter, a stakeholder register and a scope, time, cost, procurement, quality, risk and communication management.
<i>CubeSat Requirements</i>	Document indicating the requirements to be used in Preliminary Design Review
<i>Infrared Camera Requirements</i>	Document containing the basic technical requirements of the infrared camera that must be carried by the CubeSats.
<i>Infrared Camera Preliminary Design</i>	Report of the infrared camera preliminary design.
<i>Telecommunications Requirements</i>	Document indicating the requirements for the ground station and CubeSat communications.
<i>Attitude Preliminary Design</i>	Report of attitude preliminary design, which includes a first review to the navigation and attitude requirements.
<i>Telecommunications Preliminary Design</i>	Report of the telecommunications preliminary design, which includes a first review of the radio frequency system.
<i>Thermal Preliminary Design</i>	Report of the thermal preliminary design, which includes a study on the thermal insulation of each module.
<i>Energy Preliminary Design</i>	Report of the energy preliminary design, which includes the required energy sources and consumption estimations.
<i>Structure Preliminary Design</i>	Report of the mechanical preliminary design, which includes drawings to be used for the integration and assembly of the subsystems.
<i>Preliminary Design Review</i>	Report containing the basic technical description of the system and the CubeSats, as a start point of the detailed design.
<i>Communication Plan</i>	Document explaining the spreading strategy, specifying the methods used for the divulgation of the space debris issue as well as the proposed solution.
<i>Constellation Study</i>	Document containing theoretical study concerning the constellation mode of operation and orbit mechanics.
<i>On-Board Software Specifications</i>	Report containing the specifications of the developed on-board software as well as a user's guide.
<i>On-Board Software</i>	On-board software to be installed in each of the CubeSats
<i>Post-processing Software Specifications</i>	Report containing the specifications of the ground developed software as well as a user's guide.
<i>Post-processing Software</i>	Post-processing software to be used to process the data acquired in the CubeSats.
<i>Midterm Review</i>	Document with all the information related to the project until the date of delivery (for its presentation at the Midterm Review Meeting).
<i>Attitude Final Design</i>	Report of the attitude final design, which includes a final review to the navigation and attitude requirements.
<i>Infrared Camera Final Design</i>	Report of the infrared camera final design.
<i>Telecommunications Final Design</i>	Report of the telecommunications final design, which includes a final review of the radio frequency system.
<i>Thermal Final Design</i>	Report of the thermal final design, which includes a study on the thermal insulation of each module.

CubeSats for the monitoring of space debris

Deliverable Name	Description
<i>Structure Final Design</i>	Report of the mechanical final design, which includes drawings to be used in manufacturing.
<i>Energy Final Design</i>	Report of the energy final design, which includes the required energy sources and consumption estimations.
<i>Critical Design Review</i>	Document for demonstrating that the maturity of the project and the available production techniques allow the production of a prototype of CubeSat.
<i>CubeSat Specifications</i>	Document containing the specifications of the final design of the CubeSat. Drawings, set of elements, technical specifications of the components.
<i>Infrared Camera Specifications</i>	Document containing the final technical specifications of the infrared camera.
<i>CubeSat Prototype</i>	Prototype, product of the manufacturing and assembly of the components according to the Critical Design Review.
<i>Certification and Legal Requirements</i>	Document with the certifications of the different components and the ones that will be followed during the production process of the prototypes and the testing.
<i>Validation</i>	Document containing all tests and validations with the obtained results.
<i>Final Report</i>	Final document with all the information related to the project.

1.3 Project Acceptance Criteria

The following criteria are needed to be achieved before the final delivery in order to fulfill the scope and objectives of the project.

Table 2. Acceptance Criteria

Acceptance Criterion	Acceptance Condition
<i>Quality and Presentation</i>	All the documents must be organized and the information must be transmitted clearly and consistently along all the development. The presentation must be clean and visual. All the documents must be printable.
<i>Research and Innovation</i>	Research and innovation have to allow the fulfilment of the requirements which cannot be met using current technologies.
<i>Sustainability and Reliability</i>	The materials used in this project and also the energy resources must be as sustainable, reliable and efficient as possible. Component life must both be known and accomplish the requirements.
<i>Collaboration</i>	The project must collaborate with other SME and private companies, as well as universities throughout Europe.
<i>Transparency</i>	All kind of relevant information must be distributed to universities and costumers.
<i>Gender equality</i>	The recruitment must be fair and professional skills must be taken into account in order not to have gender discrimination.
<i>Performance Requirements</i>	The performance of all the systems and devices included in the CubeSats must accomplish their mission and work properly.
<i>Technical Documents</i>	The documents must include all the technical details necessary for the development of the project to allow future improvements. User's guides for the developed software and hardware must be performed.

CubeSats for the monitoring of space debris

Acceptance Criterion	Acceptance Condition
<i>Tests and Validations</i>	<p>For the acceptance of the validations, the results of the tests – which must be certified – have to be successful* in order to prove the good performance of the new technology. Each of the results has to be recorded and so do the necessary improvements for achieving the final device or system.</p> <p>*The results will be considered successful when the degree of correlation between simulations and real tests is similar to the expected.</p>

1.4 Project Exclusions

In this section, the phases of the whole DebrEyes project that are excluded from the scope for this proposal are specified.

Table 3. List of exclusions

Project Exclusions	Description
<i>Tracking unit or constellation production and assembly</i>	Only one CubeSat will be developed and assembled for testing purposes. The full constellation production is out of scope.
<i>Launch system design</i>	The objective of this project is to design a new kind of satellite, and it will not focus on the launching system.
<i>Sensor design</i>	Nonspecific sensors (except for the IR camera) will be purchased, not developed.
<i>Launching</i>	Neither the cost nor the scheduling of the launching is part of the Project.
<i>Recovering of prototypes</i>	Neither the implementation of a recovery system nor that of an auto de-orbiting system are part of the Project.
<i>Ground station</i>	During the testing phase, operative ground station will be hired externally. Definitive Ground system is out of scope.
<i>Design of a production chain</i>	The project will focus on the development of prototype models only. This excludes focusing on mass production.
<i>Final CubeSat production</i>	Commercial production of the product designed in this project is out of scope.

CubeSats for the monitoring of space debris		

1.5 Project Constraints

Different constraints that affect the execution of the project have to be considered in order to plan the development of the project, the scope and the required activities. They are specified in the table below.

Table 4. List of constraints

Project Constraints	Description
<i>Budget</i>	The amount of money available for the development of the project, which is limited, is a clear limitation or constraint.
<i>Quality</i>	Degree of success in terms of accomplishment of the project requirements. This constraint is also related to fulfil the stakeholders' expectations according to the scope.
<i>Resources</i>	Limitation in terms of human resources, working materials, services and suppliers. They have to be properly distributed due to schedule and budget limitations.
<i>Risks</i>	Uncertain events or conditions that may occur could affect the project. The high level risks should be taken into account.
<i>Scope</i>	The scope has to be completed and meet all the established requirements for finishing the project successfully.
<i>Schedule</i>	To follow the scheduling by achieving the milestones in the planned day is crucial to finish the project accomplishing the requirements and the deadline.

1.6 Project Assumptions

In order to plan the development of the project, the scope and the required activities some assumptions have been made, as listed and described below in the document. It is also indicated the impact of the assumption being wrong in the project.

Table 5. List of assumptions

Project Assumption	Description	Impact
<i>The budget is sufficient.</i>	It is possible to develop the project, according to the scope and the schedule with the available budget.	The scope of the project would have to be reduced or the productivity of the employees will have to be increased.
<i>The specifications of the CubeSat are feasible.</i>	It is possible to develop a CubeSat with the indicated specifications with the defined requirements.	The specifications would have to be changed, causing a bad impact on the stakeholders.
<i>There is enough available solar power.</i>	It is possible to power all the components of the CubeSat with the available solar power in the orbit in which it will operate.	The CubeSat would stop working and the operation would not obtain the expected outcome from the technology.
<i>The IR camera technology is feasible.</i>	It is possible to develop the IR camera technology that is required for the project, and specifically the field of vision.	The IR camera would have to be developed by an external company, causing a delay and affecting the economic viability of the project.
<i>The IR camera technology can be developed according to the schedule.</i>	It is possible to develop the required technology within the schedule indicated in the project.	The project would suffer an important delay.

 <div>UNIVERSITAT POLITÈCNICA DE CATALUNYA BARCELONATECH</div> <div>Departament de Projectes d'Enginyeria</div> <div>Secció Terrassa</div>	DebrEyes	Fecha: 22/10/15
		Pág.: 9 de 113
		Code: Group 01-PM-T2015
CubeSats for the monitoring of space debris		

Project Assumption	Description	Impact
<i>The IR precision of the cameras is sufficient.</i>	It is possible to determine the orbit of the debris with the required precision with the project technology and its performance.	The prediction of the debris position would be accurate enough for a shorter amount of time.
<i>There will be free access to bibliography.</i>	The universities which collaborate with the project will provide access to technical bibliography database.	Accessing to bibliography would become an expense for the project.
<i>There will not be stakeholder desertion.</i>	All stakeholders, especially universities which collaborate in the development will continue with the project until the end of it.	The project would suffer important delays caused by this problem.
<i>Project providers accept the orders.</i>	There will be no need for finding alternative providers.	The project would suffer delays and/or cost increases caused by this problem.
<i>It will be possible to obtain the certifications.</i>	In case of any certification required for any system, it will be possible to pass it from the original design or to amend any aspect in order to be able to pass it.	Some iterations may be required in the technical department but there will be no major delays.
<i>There will be no delays regarding report preparation.</i>	The technical managers of each department will provide the necessary reports on time.	The project would suffer delays caused by this problem. If the delays of the reports resulted in delays of the deliveries and the no presentation of the necessary documents in meetings, it would cause a bad impact on the stakeholders.
<i>Testing can be done in separately for different components, without all the subsystems being totally finished.</i>	It is possible to begin the testing activity with some parts of the whole CubeSat unfinished, by analysing some of the systems separately.	The testing activity would not be able to begin as planned, causing delays.

2 Work Breakdown Structure (WBS)

The WBS of the DebrEyes project is presented below. The tasks have been classified into five different blocks, considering the department by whom they have to be developed.

1. PROJECT MANAGEMENT

- 1.1. DEVELOPMENT OF THE PROJECT MANAGEMENT PLAN
- 1.2. MONITORING OF THE PROJECT
- 1.3. DEVELOPMENT OF MIDTERM REVIEW
 - 1.3.1. Development of Midterm Review Report
 - 1.3.2. Development of Midterm Review Presentation
- 1.4. DEVELOPMENT OF CRITICAL DESIGN REVIEWING
- 1.5. FINAL DELIVERY
 - 1.5.1. Preparation of Final Report
 - 1.5.2. Preparation of Final Presentation

CubeSats for the monitoring of space debris

2. ADMINISTRATION

2.1. HHRR

2.1.1. Employment of the necessary staff

2.1.2. HHRR management

2.2. FINANCES

2.2.1. Development of the financial plan

2.3. PROCUREMENT

2.3.1. Studying the suppliers

2.3.2. Negotiation of the conditions for procurement with the suppliers

2.3.3. Purchasing of materials and resources

2.4. SALES

2.4.1. Analysis of the potential market

2.4.2. Communication with potential customers

3. MARKETING

3.1. WEBSITE DEVELOPMENT

3.2. SOCIAL MEDIA MANAGEMENT

3.3. DEVELOPMENT OF THE COMMUNICATION PLAN

4. QUALITY

4.1. DOCUMENTATION MANAGEMENT

4.1.1. Guidelines preparation

4.1.2. Document revision

4.1.3. Document rectification

4.1.4. Document approval

5.1.3.1. Ground Control Initial Development

5.1.3.1.1. Development of Requirements study

5.1.3.1.2. Research of the current technologies

5.1.3.2. CubeSat data transmission initial development

5.1.3.2.1. Study of existing equipment

5.1.3.2.2. Development of Requirements study

5.1.3.2.3. Development of CubeSat Requirements Review

5.1.3.3. Development of Galileo data transmission

5.1.4. Attitude control system initial development

5.1.4.1. Study of the available options to determine and control the attitude

5.1.4.2. Study of the possible exogenous factors

5.1.5. Constellation initial study development

5.1.5.1. Development of Requirements study

5.1.5.2. Research of exploited orbits with similar satellites and similar missions

5.1.5.3. Analysis of orbits and manoeuvres

5.1.6. Energy system initial development

5.1.6.1. Development of Requirements study

5.1.6.2. Study of different methods for energy obtaining

5.1.6.3. Research on different storage methods

5.1.7. Thermal control system initial development

5.1.7.1. Study of thermal isolators and heat sinks

5.1.7.2. Research on the thermal sensitivity of different subsystems

5.1.8. Structures initial development

5.1.8.1. Mechanical requirements study

5.1.8.2. Research on lightweight materials for space missions

5.1.9. Software Initial Development

5.1.9.1. Image processing system initial development

5.1.9.1.1. Development of Image processing software's requirements study

5.1.9.1.2. Research on image processing techniques

5.1.9.2. Development of On-board software's requirements study

5.2. DEVELOPMENT OF THE PRELIMINARY DESIGN

5.2.1. Development of Infrared Camera preliminary design

5.2.1.1. Predesign of the IR camera to fit the requirements of the mission

5.2.1.2. Development of Infrared Camera Preliminary Design report

CubeSats for the monitoring of space debris

5.2.2. Telecommunications initial development

5.2.2.1. Development of Ground Control preliminary design

5.2.2.1.1. Definition of minimum performance parameters

5.2.2.2. CubeSat data transmission

5.2.2.2.1. Development of Ground Transmission Preliminary Design

5.2.2.2.1.1. Definition of minimum performance parameters

5.2.2.2.1.2. Predesign of the transmitter system

5.2.2.2.1.3. Predesign of the antenna

5.2.2.2.1.4. Approximation of the power required

5.2.2.2.2. Development of CubeSats Communication System Preliminary Design

5.2.2.2.2.1. Definition of minimum performance parameters

5.2.2.2.2.2. Predesign of the transmitter system

5.2.2.2.2.3. Predesign of the antenna

5.2.2.2.2.4. Approximation of the required power

5.2.2.3. Development of Galileo positioning system Preliminary Design

5.2.2.3.1. Study of the integration of the antenna

5.2.2.4. Preparation of Telecommunication Preliminary Design Report

5.2.3. Development of Attitude Control System Preliminary Design

5.2.3.1. Determination of the minimum attitude requirements

5.2.3.2. Choosing the appropriate systems

5.2.3.3. Preparation of Attitude Preliminary Design report

5.2.4. Development of Energy System Preliminary Design

5.2.4.1. Predesign of the method for the energy collection

5.2.4.2. Predesign of the storage method

5.2.4.3. Preparation of Energy Preliminary Design report

5.2.5. Development of Thermal Control System Preliminary Design

5.2.5.1. Thermal study for determining the optimal operational temperature

5.2.5.2. Predesign of thermal control subsystem according to operational temperatures

5.2.5.3. Preparation of Thermal Preliminary Design report

5.2.6. Development of Software Preliminary Design

5.2.6.1. Implementation of the basic functions of the on-board software

5.2.6.2. Implementation of the basic functions of the post-processing software

5.2.7. Integration and assembly

5.2.7.1. Predesign of the structure

5.2.7.2. Study of interference between subsystems

5.2.7.3. Predesign of the assembly procedure

5.2.7.4. Preparation of Structure Preliminary Design report

5.2.8. Development of Preliminary Design Review

CubeSats for the monitoring of space debris

5.3. DEVELOPMENT OF THE FINAL DESIGN

5.3.1. Development of Infrared Camera Final Design

5.3.1.1. Design of the infrared camera

5.3.1.2. Preparation of Infrared Camera Final Design report

5.3.1.3. Development of Infrared Camera Specifications

5.3.2. Development of Telecommunications Final Design

5.3.2.1. Development of Ground Control Final Design

5.3.2.1.1. Design of the ground control system

5.3.2.2. Development of CubeSat data transmission system Final Design

5.3.2.2.1. Design of the transmitter system

5.3.2.2.2. Design of the antenna

5.3.2.3. Development of Galileo Data Transmission System Final Design

5.3.2.3.1. Integration of the antenna

5.3.2.4. Preparation of Telecommunications Final Design Report

5.3.3. Development of Attitude control System Final Design

5.3.3.1. Determination of the minimum attitude requirements

5.3.3.2. Choosing the appropriate systems

5.3.3.3. Development of Attitude Final Design report

5.3.4. Development of Constellation Final Design

5.3.4.1. Study of potential orbits and manoeuvres

5.3.4.2. Study of the relative orbits in a tracking unit

5.3.4.3. Computation of the necessary number of tracking units

5.3.4.4. Design of the orbits and manoeuvres for the constellation

5.3.4.5. Constellation Study report

5.3.5. Development of Energy System Final Design

5.3.5.1. Design of the method for the energy collection

5.3.5.2. Design of the storage method

5.3.5.3. Development of Energy Final Design report

5.3.6. Development of Thermal Control System Final Design

5.3.6.1. Design of thermal control subsystem according to operational temperatures

5.3.6.2. Development of Thermal Final Design report

5.3.7. Development of Software Final Design

5.3.7.1. On-board Software Final Development

5.3.7.1.1. Testing of the preliminary version and fixing of the bugs

5.3.7.1.2. Enhancement of the functions for meeting the established requirements

5.3.7.1.3. Development of On-board Software Specifications

5.3.7.2. Post-processing Software Final Development

5.3.7.2.1. Testing of the preliminary version and fixing of the bugs

5.3.7.2.2. Enhancement of the functions for meeting the established requirements

5.3.7.2.3. Development of Post-processing Software Specifications

5.3.7.2.4. Development of a user-friendly UI

5.3.7.2.5. Development of Post-processing Software Specifications

CubeSats for the monitoring of space debris

5.3.8. Development of Structures Final Design

5.3.8.1. Design of the structure

5.3.8.2. Development of Structure Final Design report

5.3.9. Integration and Assembly final development

5.3.9.1. Detailed study of the integration of the subsystems into the structure

5.3.9.2. Design of the assembly procedure

5.3.9.3. Development of CubeSat Specifications

5.4. DEVELOPMENT OF MANUFACTURE AND ASSEMBLY OF THE PROTOTYPE OF CUBESAT

5.4.1. Manufacturing of the on-board communications subsystem prototype

5.4.2. Manufacturing of the attitude control subsystem prototype

5.4.3. Manufacturing of the energy subsystem prototype

5.4.4. Manufacturing of the thermal control subsystem prototype

5.4.5. Manufacturing of the structure subsystem prototype

5.4.6. Implementation of the on-board software

5.4.7. Final assembly of the prototype

5.5. DEVELOPMENT OF SIMULATION, TESTING AND VALIDATION

5.5.1. Infrared Camera Testing

5.5.2. Telecommunications ground testing

5.5.3. Constellation simulation

5.5.4. Energy testing

5.5.5. Structures testing

5.5.5.1. Impact testing

5.5.5.2. Vibrations testing

5.5.5.3. Software for the Monitoring final testing

5.5.6. Software for the Monitoring final testing

5.5.7. Preparation of Validation report

CubeSats for the monitoring of space debris

The previous list is summarized in the following diagram Figure 4:

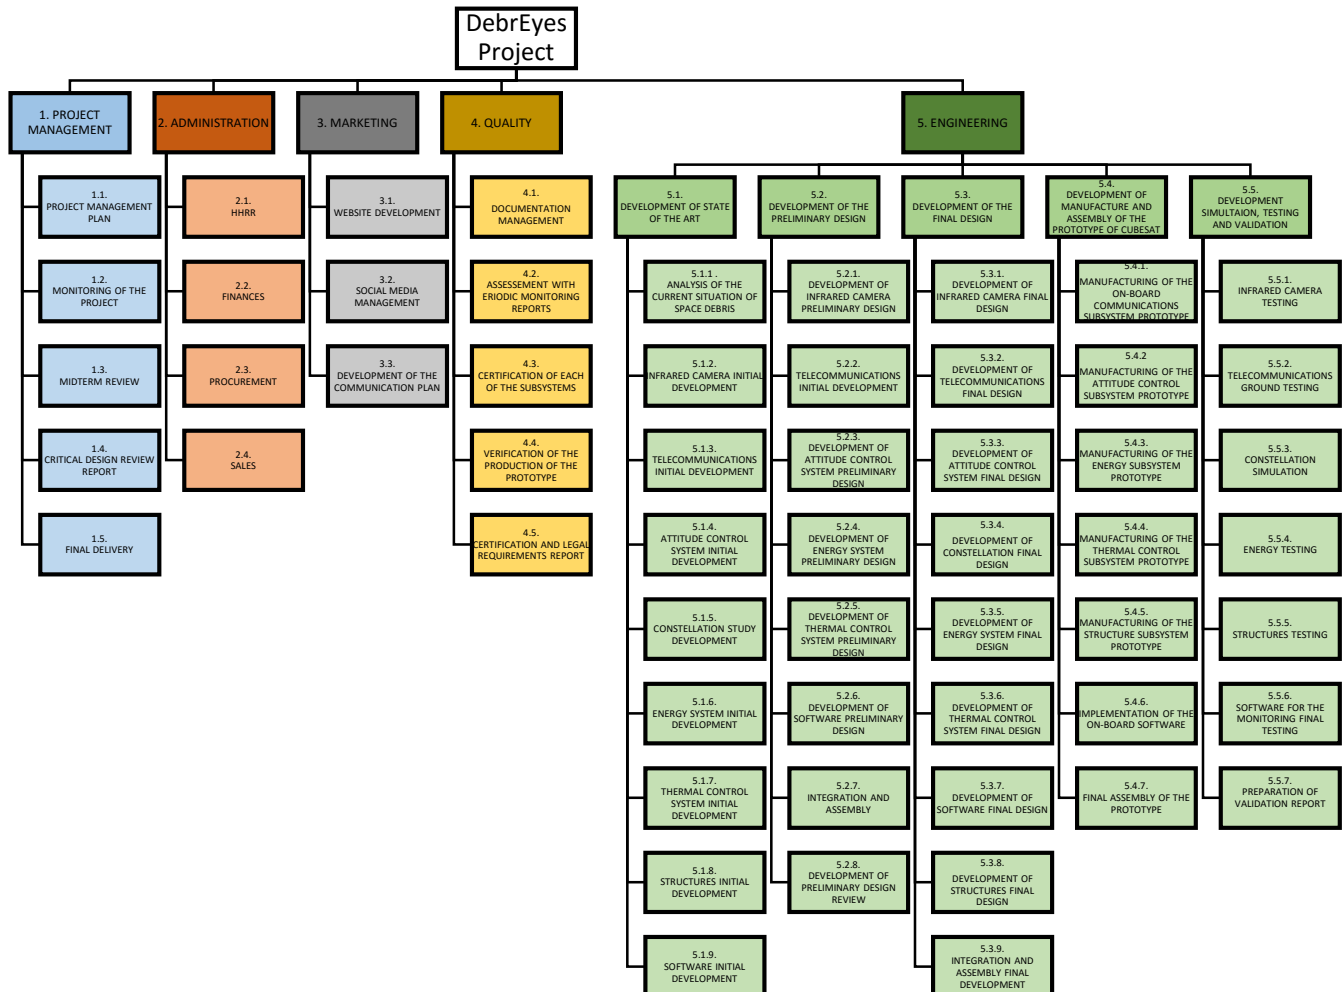

Figure 4. WBS Diagram

CubeSats for the monitoring of space debris		

2.1 Activity list

In this section, each of the activities of the WBS is described. The list below contains the ID and the name of the tasks, as well as their corresponding definition.

Table 6. List of project activities

WBS_ID	Activity	Description
1.	PROJECT MANAGEMENT	
1.1.	<i>Development of the Project Management Plan</i>	Development of the project management plan in order to have the guidelines to be able to control the project.
1.2.	<i>Monitoring of the project</i>	Keep constant track of the current status of the project.
1.3.	<i>Development of Midterm Review</i>	Ensuring that tasks are on date and drawing up the appropriate report.
1.4.	<i>Development of Critical Design Reviewing</i>	Carry out a multidisciplinary technical review to ensure that the system can advance into manufacture, demonstration and test.
1.5.	<i>Final delivery</i>	Delivery of the final documents and presentation.
2.	ADMINISTRATION	
2.1.	HRRR	
2.1.1.	<i>Employment of the necessary staff</i>	Employment of the necessary staff directly necessary to perform the project.
2.1.2.	<i>HRRR management</i>	Continuous control, checking and management of human resources, being aware of any change needed to ensure a satisfactory end of the project.
2.2.	FINANCES	
2.2.1.	<i>Development of the financial plan</i>	Evaluate the cost required by each of the departments in order to carry on the project.
2.3.	PROCUREMENT	
2.3.1.	<i>Studying the suppliers</i>	Study of the possible suppliers for any external resource necessary to carry out the project and the assembly of the CubeSat.
2.3.2.	<i>Negotiation of the conditions for procurement with the suppliers</i>	Negotiation of the conditions for procurement with the suppliers in order to minimize the cost of the external procurement.
2.3.3.	<i>Purchasing of materials and resources</i>	Purchase of all the external resources necessary to carry out the project and the assembly of the CubeSat.
2.4.	SALES	
2.4.1.	<i>Analysis of the potential market</i>	Extensive analysis of all the companies in the market to identify any potential customer of the output of the project.
2.4.2.	<i>Communication with potential customers</i>	Start the contact with the selected potential customers in order to introduce the product and create a business relationship.

CubeSats for the monitoring of space debris

WBS_ID	Activity	Description
3.	MARKETING	
3.1.	Website development	Development and maintenance of the project's website.
3.2.	Social Media management	Applications and activities to enable users to participate in social networking.
3.3.	Development of the Communication Plan	Development of the communication plan in order to have the guidelines to manage the contact with future users and general population.
4.	QUALITY	
4.1.	Documentation management	Prepare guidelines for the documentation and carry out document revision, rectification and approval.
4.2.	Assessment with periodic monitoring reports	Preparing internal reports regarding the application of the quality criteria.
4.3.	Certification of each of the subsystems	Ensuring that each one of the sub-systems fulfil any legal certification required to be able to develop their functionality.
4.4.	Verification of the production of the prototype	Ensuring that the production of the prototype is carried out according to the requirements and design.
4.5.	Certification and Legal Requirements Document	Writing the document on certifications and legal requirements.
5.	ENGINEERING	
5.1.	DEVELOPMENT OF THE STATE OF THE ART	
5.1.1.	Analysis of the current situation of the space debris	Information research about the trace and the size of the debris detected and their increase ratio along the time. As well as research of studies of their future increase, potential dangers, approaches of the amount of non-detectable debris and projects to reduce their impact.
5.1.2.	Infrared Camera initial development	Research of IR technologies available for CubeSats, in order to make a comparison, study of the characteristics and requirements of the IR camera for debris detection and development of a report with the requirements of the IR camera.
5.1.3.	Telecommunications initial development	
5.1.3.1.	Ground Control initial development	Study of the requirements of the ground control and research on current technologies.
5.1.3.2.	CubeSat data transmission system initial development	Study of the existent data transmission equipment, study of the requirements and elaboration of a review of those requirements.
5.1.3.3.	Galileo data transmission system initial development	Documentation about the data transmission used by the Galileo and the available devices to positioning the CubeSats.
5.1.4.	Attitude control system initial development	Research of the attitude control methods than are be able to operate in the CubeSats and study of the external factors that could modify their attitude and the trajectory.

CubeSats for the monitoring of space debris

WBS_ID	Activity	Description
5.1.5.	<i>Constellation initial study development</i>	Study of the requirements needed to develop a tracking unit. Research of the orbits where the constellation give the optimum performance. Study of the most polluted orbits and research of similar satellites designed to carry out similar missions. Posterior analysis of the optimum orbits where the tracking unit can be implemented and study of the maneuvers needed in order to preserve the integrity and functionality of the constellation.
5.1.6.	<i>Energy system initial development</i>	Study of the energetic requirements for one CubeSat. This task includes an analysis of the power needed for the optimum performance of each subsystem implemented in the CubeSat based on similar missions, a study on current methods available for energy obtention for a CubeSat and a study of different energy storage methods.
5.1.7.	<i>Thermal control system initial development</i>	Study of the current thermal isolators and heat sinks used in CubeSats or other space structures and analysis of the most suitable method for a proper performance of a DebrEye. Research of the thermal properties of each of the subsystems for defining their operational temperatures so as to ensure a good functioning of the whole system.
5.1.8.	<i>Structures initial development</i>	The requirements for the structure of the CubeSat will be determined and a study on lightweight materials for space applications will be carried out.
5.1.9.	<i>Software initial development</i>	
5.1.9.1.	<i>Image processing system initial development</i>	The requirements for the post-processing software of the images obtained by the CubeSat will be determined and a study of the bibliography will get a wide view of the State of the Art on Image processing and evaluate which technique is the most suitable according to the requirements.
5.1.9.2.	<i>Development of On-board software's requirements study</i>	The requirements for the on-board software of the CubeSat will be determined.
5.2.1.	<i>Development of Infrared Camera preliminary design</i>	Predesign of the IR camera to fit the requirements of the mission is developed, as well as a written report about it.
5.2.2.	<i>Telecommunications initial development</i>	
5.2.2.1.	<i>Development of Ground Control preliminary design</i>	Definition of the minimum parameters for ground control.
5.2.2.2.1.	<i>Development of Ground Transmission Preliminary Design</i>	The design of the ground transmission is developed, it includes definition of the minimum performance parameters needed, predesigns of the transmitter system and the antenna and also the approximation of the power required.
5.2.2.2.2.	<i>Development of CubeSats Communication System Preliminary Design</i>	The communication between CubeSats is developed, it includes the definition of the minimum performance parameters needed, the predesigns of the transmitter system and the antenna, as well as the approximation of the power required.

CubeSats for the monitoring of space debris

WBS_ID	Activity	Description
5.2.2.3.	<i>Development of Galileo Positioning System Preliminary Design</i>	A study of the integration of the antenna is done in order to use Galileo to position the CubeSats.
5.2.2.4.	<i>Preparation of Telecommunication Preliminary Design Report</i>	A report of the telecommunications subsystems is developed.
5.2.3.	<i>Development of Attitude Control System Preliminary Design</i>	Determination of the minimum attitude requirements for the attitude control, choice of the appropriate systems and development of a report of the preliminary design of this subsystem.
5.2.4.	<i>Development of Energy System Preliminary Design</i>	Predesign of the methods of energy collection, storage and development of a preliminary energy design report.
5.2.5.	<i>Development of Thermal Control System Preliminary Design</i>	The study for determining the optimal operation temperature and the predesign of the thermal control subsystems are developed and reported.
5.2.6.	<i>Development of Software Preliminary Design</i>	
5.2.6.1.	<i>Implementation of the basic functions of the on-board software</i>	The implementation of the basic functions of the on-board software is done.
5.2.6.2.	<i>Implementation of the basic functions of the post-processing software</i>	The implementation of the basic functions of the post-processing software is developed.
5.2.7.	<i>Integration and assembly</i>	The preliminary design of the structure, the assembly and integration of the subsystems are developed and reported.
5.2.8.	<i>Development of Preliminary Design Review</i>	Review of all the preliminary studies and reports.
5.3.	DEVELOPMENT OF THE FINAL DESIGN	
5.3.1.	<i>Development of Infrared Camera Final Design</i>	Final design of the IR camera for the detection of space debris.
5.3.2.	<i>Development of Telecommunications Final Design</i>	
5.3.2.1.	<i>Development of Ground Control Final Design</i>	Final design of the ground control system for the communication with the CubeSats.
5.3.2.2.	<i>Development of CubeSat data transmission system Final Design</i>	Final design of the transmitter system and antennas for data transmission between CubeSats.
5.3.2.3.	<i>Development of Galileo Data Transmission System Final Design</i>	Development of the communication system with the Galileo positioning satellites.
5.3.2.4.	<i>Preparation of Telecommunications Final Design Report</i>	Report including the final design of all the telecommunications systems of the CubeSat, which include the ground control development, the data transmission between CubeSats and the Galileo data transmission.
5.3.3.	<i>Development of Attitude control System Final Design</i>	Final design of the subsystem for the attitude control of the CubeSats and development of a report.
5.3.4.	<i>Development of Constellation Final Design</i>	Design of the orbits and maneuvers for the future DebrEyes constellation and development of a report.
5.3.5.	<i>Development of Energy System Final Design</i>	Final design of the energy subsystem through the precise definition of the energy storage method. Development of a report of the design of this subsystem.

CubeSats for the monitoring of space debris

WBS_ID	Activity	Description
5.3.6.	<i>Development of Thermal Control System Final Design</i>	The necessary components and parts must be defined to guarantee the appropriate temperature in all the components and writing the report regarding to the thermal control design.
5.3.7.1.	<i>On-board Software Final Development</i>	Development of the final version of the on-board program and writing of the specifications of the software.
5.3.7.2.	<i>Post-processing Software Final Development</i>	Development of the final program to compute the velocity, position and orbits from the data provided by the CubeSats and writing of the specifications of the software.
5.3.8.	<i>Development of Structures Final Design</i>	Final design of the structure of the CubeSat and development of a written report containing its features.
5.3.9.	<i>Integration and Assembly final development</i>	Final design of the integration of all the subsystems. Design of the assembly procedure and writing of a user's guide. Development of a report with the CubeSat final specifications.
5.4.	DEVELOPMENT OF MANUFACTURE AND ASSEMBLY OF THE PROTOTYPE OF CUBESAT	
5.4.1.	<i>Manufacturing of the on-board communications subsystem prototype</i>	Manufacture the prototype for the on-board communications subsystem.
5.4.2.	<i>Manufacturing of the attitude control subsystem prototype</i>	Manufacture the prototype for the attitude control subsystem.
5.4.3.	<i>Manufacturing of the energy subsystem prototype</i>	Manufacture the prototype for the energy subsystem.
5.4.4.	<i>Manufacturing of the thermal control subsystem prototype</i>	Manufacture the prototype for the thermal control subsystem.
5.4.5.	<i>Manufacturing of the structure subsystem prototype</i>	Manufacture the prototype for the structure subsystem.
5.4.6.	<i>Implementation of the on-board software</i>	Implement the on-board software to the prototype.
5.4.7.	<i>Final assembly of the prototype</i>	Assemble all the subsystem's prototypes into the final prototype.
5.5.	DEVELOPMENT OF SIMULATION, TESTING AND VALIDATION	
5.5.1.	<i>Infrared Camera Testing</i>	Ensuring that the IR Camera fulfil all requirements and that it is able to develop his functionality.
5.5.2.	<i>Telecommunications ground testing</i>	Ensuring that the telecommunications system fulfil all requirements and that it is able to develop his functionality.
5.5.3.	<i>Constellation simulation</i>	Ensuring that the constellation is possible and useful in order to get the expected results.
5.5.4.	<i>Energy testing</i>	Ensuring that the energy system fulfil all requirements and that it is able to develop his functionality.
5.5.5.	<i>Structures testing</i>	Ensuring that the structure fulfil all requirements and that it is able to develop his functionality.
5.5.6.	<i>Software for the Monitoring final testing</i>	Ensuring that the software fulfil all requirements and that it is able to develop his functionality.
5.5.7.	<i>Preparation of Validation report</i>	Writing the document.

CubeSats for the monitoring of space debris

3 Sequence activities

3.1 Dependencies or logical relationship between activities

In this section, a table with the dependencies between activities is presented – Table 7. The legend used for the relationships is specified at the end of the table.

Table 7. List of relationships between activities

CubeSats for the monitoring of space debris		

4 Estimate activity resource

4.1 Resource identification

The resources identified in this project can be divided in three main types:

- **Worker:** person who works within the project employed by DebrEyes, by the partnership companies or investigators of the collaborating universities.
- **Material:** the different physical resources needed for the project. In this project, they are mainly associated with the software used.
- **Facilities:** places and services, such as a room for assembling the CubeSat or a validation of it, provided by external companies which have an associated cost.

Moreover, in the case of the workers, different level of knowledge and expertise are needed. Five categories are considered:

- **Expert:** They have a wide knowledge in a particular area. They can provide guidance, troubleshoot and answer questions related to this area of expertise.
- **Senior:** They can perform the actions associated with the area without assistance due to their huge previous experience.
- **Average:** They are able to successfully complete tasks in this competency as requested. Help from an expert may be required from time to time, but they can usually perform the skill independently.
- **Junior:** They have the level of experience gained in a classroom and/or experimental scenarios or as a trainee on-the-job. They are expected to need help when performing this skill.

The resources needed in this project are listed and detailed in the Table 8:

Table 8. List of resources

Resource ID	Description of the resource	Type of resource	Level of knowledge
<i>PM.M</i>	Project Manager	Worker	Expert
<i>PM.S</i>	Project Manager Secretary	Worker	Average
<i>AS.M</i>	Administrative Services Manager	Worker	Expert
<i>AS.S</i>	Administrative Services Secretary	Worker	Average
<i>C.M</i>	Communication Manager	Worker	Expert
<i>FM</i>	Financial Manager	Worker	Expert
<i>HR.M</i>	Human Resources Manager	Worker	Expert
<i>QM.M</i>	Quality Manager	Worker	Senior
<i>QM.S</i>	Quality Manager Secretary	Worker	Junior
<i>SD.M</i>	Sales Department Manager	Worker	Expert
<i>T.M</i>	Technical Manager	Worker	Senior
<i>ACE.M</i>	Attitude Control Engineering Manager	Worker	Senior

CubeSats for the monitoring of space debris

Resource ID	Description of the resource	Type of resource	Level of knowledge
ACE	Attitude Control Engineer	Worker	Average
EE.M	Energy Engineering Manager	Worker	Senior

4.3 Resource Breakdown Structure

In this section, a scheme of the resources needed in this project are detailed. It includes people, software, facilities and locations.

1. PROJECT

1.1. PEOPLE

- 1.1.1. Project Management
 - 1.1.1.1. *Expert Project Manager*
 - 1.1.1.2. *Average Project Manager Secretary*
- 1.1.2. Administration
 - 1.1.2.1. *Expert Administrative Services Manager*
 - 1.1.2.2. *Average Administrative Services Secretary*
- 1.1.3. Communication
 - 1.1.3.1. *Expert Communication Manager*
- 1.1.4. Financial
 - 1.1.4.1. *Expert Financial Manager*
- 1.1.5. Human Resources
 - 1.1.5.1. *Expert Human Resources Manager*
- 1.1.6. Quality
 - 1.1.6.1. *Senior Quality Manager*
 - 1.1.6.2. *Junior Quality Manager Secretary*
- 1.1.7. Sales
 - 1.1.7.1. *Expert Sales Department Manager*
- 1.1.8. Engineering
 - 1.1.8.1. *Senior Technical Manager*
 - 1.1.8.2. *Attitude Control*
 - 1.1.8.2.1. *Senior Attitude Control Engineering Manager*
 - 1.1.8.2.2. *Average Attitude Control Engineer*
 - 1.1.8.3. *Energy*
 - 1.1.8.3.1. *Senior Energy Engineering Manager*
 - 1.1.8.3.2. *Average Energy Engineer*
 - 1.1.8.4. *Mechanical*
 - 1.1.8.4.1. *Senior Mechanical Engineering Manager*
 - 1.1.8.4.2. *Average Mechanical Engineer*
 - 1.1.8.5. *Software*
 - 1.1.8.5.1. *Senior Software Engineering Manager*
 - 1.1.8.5.2. *Expert Software Engineer*
 - 1.1.8.5.3. *Junior Software Engineer*
 - 1.1.8.6. *Sensing*
 - 1.1.8.6.1. *Senior Sensing Engineering Manager*
 - 1.1.8.6.2. *Junior Sensing Engineer*
 - 1.1.8.7. *Space*
 - 1.1.8.7.1. *Senior Space Engineering Manager*
 - 1.1.8.7.2. *Expert Space Engineer*
 - 1.1.8.7.3. *Junior Space Engineer*

CubeSats for the monitoring of space debris

5 Estimate activity duration

In this section, the duration of the activities are estimated. Parametric, analogous and three point estimate are the different methods used for this calculations and the results are shown in Table 10, Table 11 and Table 12, respectively.

Table 10. List of parametric estimates

Parametric Estimates					
WBS ID	Effort Hours	Resource Quantity	% Available	Performance Factor	Duration Estimate (h)
1.1.	4	2	0.6	0.95	5
2.1.1.	8	3	0.8	0.7	13
2.2.1.	2	4	0.6	0.95	5
2.4.1.	70	1	0.9	0.95	60
2.4.2.	126	1	0.5	0.95	60
3.1.	148	1	0.3	0.9	40
3.2.	125	1	0.2	0.8	20

Table 11. List of analogous estimates

Analogous Estimates					
WBS ID	Previous Activity	Previous Duration	Current Activity	Multiplier	Duration Estimate
1.2.	Previous project Monitoring Time Cost	57	Monitoring of the project	0.9	52
1.3.	Previous project development of the Midterm Review	6	Midterm Review development	0.8	5
1.4.	Previous project development of the Midterm Review	6	Critical Design Review development	0.8	5
1.5.	Previous project development of the Midterm Review	6	Critical Design Review development	0.5	3
2.1.2.	Previous project HHRR continuous management Time Cost	550	HHRR management	0.9	500
5.2.2.4.	Previous project Design Report	10	Telecommunication Preliminary Design Report preparation	1	10
5.2.8.	Previous project Design Review development	15	Preliminary Design Review development	0.7	10
5.3.2.4.	Previous project Design Report	10	Telecommunication Preliminary Design Report preparation	0.3	3
5.3.9.	Previous project Design Review development	15	Preliminary Design Review development	1.3	20
5.5.7.	Previous project Design Review development	15	Preliminary Design Review development	0.7	10

CubeSats for the monitoring of space debris

Table 12. List of three point estimates

Three Point Estimates					
WBS ID	Optimistic Duration	Most Likely Duration	Pessimistic Duration	Weighting Equation	Expected Duration Estimate
2.3.1.	30	60	90	$(o+4m+p)/6$	60
2.3.2.	23	30	37	$(o+4m+p)/6$	30
2.3.3.	19	25	31	$(o+4m+p)/6$	25
3.3.	5	10	15	$(o+4m+p)/6$	10
4.1.	520	520	520	$(o+4m+p)/6$	520
4.2.	515	515	515	$(o+4m+p)/6$	515
4.3.	53	70	87	$(o+4m+p)/6$	70

Access to bibliography and literature.					
Included tasks:					
5.1.4.1. Study of available options to determine and control the attitude					
5.1.4.2. Study of the possible exogenous factors					

CubeSats for the monitoring of space debris

Table 40. Attributes of the activity 5.1.5. Constellation initial study development

WBS-ID:		Activity:			
5.1.5.		Constellation initial study development			
Description of Work:					
Study of the requirements needed to develop a tracking unit. Research of the orbits where the constellation give the optimum performance. Study of the most polluted orbits and research of similar satellites designed to carry out similar missions. Posterior analysis of the optimum orbits where the tracking unit can be implemented and study of the maneuvers needed in order to preserve the integrity and functionality of the constellation.
